

TUFFease®

Pressure Reducing Gel Pads

Nurses told us three ways to make our pressure pads better.
So we did.

- "...a softer, more supple cover for added patient protection."

- "...more durable materials less likely to be punctured or torn."

- "...a gel alternative that cuts the petroleum problem."

Improved TUFFease® pressure redistributing gel pads make it easier than ever to help prevent pressure ulcers. Now more comfortable, more durable, environmentally friendly and easier to clean.

TUFFease®

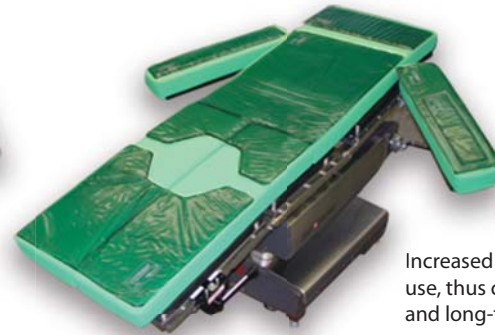

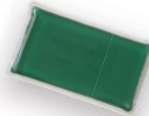

Our proprietary, environmentally friendly plant-oil based gel reduces costs associated with petroleum-based products.

New TUFFease® gel contoured shaped product's underside surface is more durable because of an added thickness that helps prevent damage or tearing when the pad is being moved or placed in storage.

The new TUFFease® gel pad has been produced with a sleeker, shinier surface material to alleviate skin shear and give greater protection against skin breakdown.

Increased durability can lead to longer use, thus cost savings, in hospital and long-term healthcare facilities where pressure redistribution products are necessary to help prevent pressure ulcers.

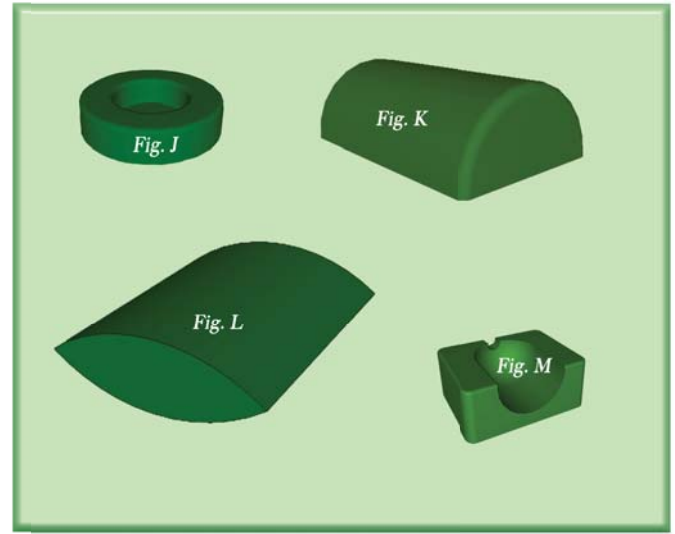

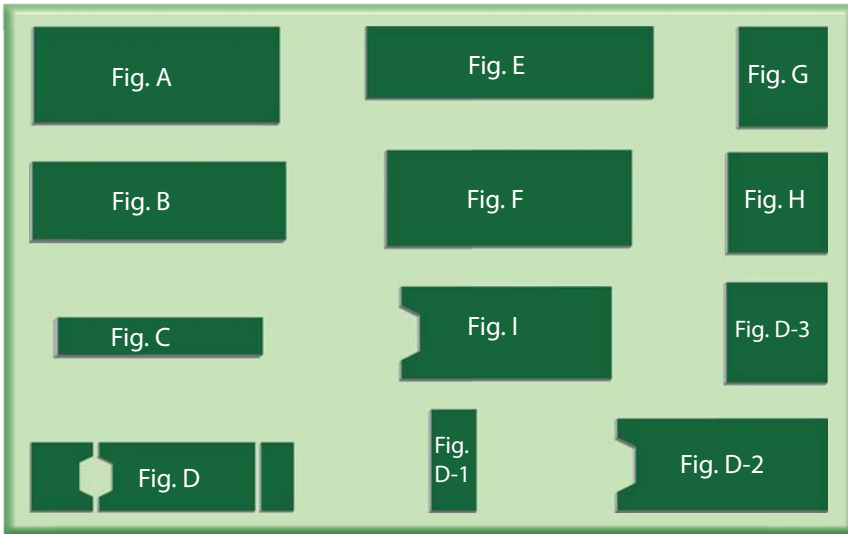

TUFFease® gel products simulate an immersion flotation experience for the patient, lessening and redistributing pinpoint pressure.

"We are always looking for ways to ensure more effective patient protection from pressure ulcers," said Greg Prentiss, Gel Manager at IMP. "Our new formula TUFFease® gel products not only advance that commitment to patient protection but also make it easier for hospital personnel to store and clean. Both patient and provider will benefit from the IMP advancement."
